Intl Patent Class	G06F-017/60; G06F-153/02
Abstract	AU9712306 A The method involves a vendor establishing a booking record on a database. The booking record includes information relating to number of available booking units. An end user establishes a connection with the database. The user interrogates the database according to users booking criteria. If a free booking unit is available in a particular booking record corresponding to end user users ultimate selection, the database transmits that information to the end user. The end user optionally selects the booking unit or returns to the interrogation step. The end user pays for product or service corresponding to that booking unit. The database is updated to reflect the sale of a booking unit. ADVANTAGE: Provides process of querying database that leads user through question and request to make appropriate booking on spot. Prevents user from gathering excess and unwanted information.
